- 6 Conclusion

# Introduction

## Context

- Since 2007, the Research Center for Ethnomusicology (CREM) and Parisson have been developing an innovative, collaborative and open-source **web-based multimedia platform** for **humanities and social sciences research**.
- Official platform online since 2010 :  
*Sound archives of the CNRS - Musée de l'Homme*  
<http://archives.crem-cnrs.fr>
- This **collaborative** platform support numerous aspects of the field of **ethnomusicology**, ranging from musical analysis to comparative history and the anthropology of music. The platform also provides many useful resources for the fields of anthropology, linguistics and acoustics.

# Introduction

Towards automatic audio content analysis ...

- Recently, an open-source **audio analysis framework**, TimeSide, has been developed to bring automatic audio content analysis capabilities to the Telemeta web platform.

... and interdisciplinary collaboration

- Since 2013, as part of the DIADEMS project, academic researchers and engineers from the *Science and Technology of Information and Communication* domain and researchers from the *Musicology and Ethnomusicology* domain have been collaborating to develop new computer tools to **automatically index** the recording contents.

# The Telemeta platform

## 1 Introduction

## 2 The Telemeta platform

- Web audio content management features
- Metadata

## 3 TimeSide, an audio analysis framework

## 4 Sound archives of the CNRS - Musée de l'Homme

## 5 The DIADEMS project

## 6 Conclusion

# The Telemeta platform

## A web audio platform

The primary purpose of the project is to provide researchers working on audio materials with a scalable system to:

- access, preserve and share **sound items** and
- access and enrich **associated metadata** that contains key information on the context and significance of the recording.

## An open-source software

- Telemeta, is a **free and open source software (GPL-like licence)** in accordance with **open web standards**.

<http://telemeta.org/>

# Web audio content management features and architecture

## Main features of Telemeta

- Pure **HTML5** web user interface including dynamic forms.
- Database management through Strong Structured Query Language (**SQL**) or Oracle backend.
- **On-the-fly audio analyzing**, transcoding and metadata embedding in various multimedia formats, provided through an external component, *TimeSide*.
- Social editing with semantic ontologies, smart workflows, human or automatic annotations and segmentations.
- **User management** with individual desk, playlists, profiles and group access rights.
- High level **search engine** geolocation, instruments, ethnic groups, etc...).
- Multi-language support (currently english, german, french and chinese).

# Metadata

In addition to the audio data, an efficient and dynamic management of the associated metadata is also offered.

- Metadata provides valuable informations about the **source of the data** and to the related **work of peer researchers**.
- Dynamically handling metadata in a **collaborative** manner optimizes the continuous process of knowledge gathering and the **enrichment** of the materials in the database.
- One of the major challenges is the **standardization** of audio and metadata formats with the aim of long-term preservation and usage of the different materials.
- The compatibility with other systems is facilitated by the integration of the **metadata standards protocols** *Dublin Core* and *OAI-PMH* (Open Archives Initiative Protocol for Metadata Harvesting).

# Metadata

## Contextual Information

### Contextual Information

In an ethnomusicological framework, contextual information may include:

- Geographic information
- Cultural information ( population, related cultural elements, ...)
- Musical information ( title, instruments, ...)
- Archive or recording information (recording technical data, depositor, collector, year of the recording, year of publication of papers describing the work, ...)

### Additional materials

Moreover, through the platform, diverse materials related to the archives can be stored, such as:

- iconographies (digitalized pictures, scans of booklets and field notes, and so on),
- hyperlinks and
- biographical information about the collector.

### Examples

# Descriptive and analytical information

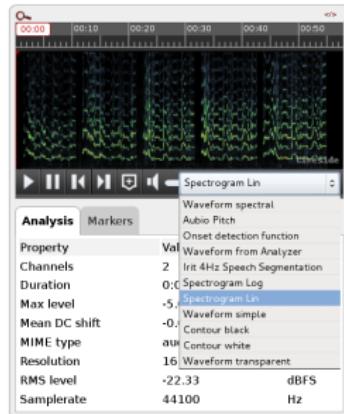

## Visual representation and segmentation

### Visual representation of the sound

The embedded TimeSide audio player allows for a selection of various visual representations of the sound (e.g. **waveforms and spectrograms**) and some representations of computational **analysis**.

### Segmentation

Automatic analysis can produce a list of **time-segments** associated with **labels** (e.g. detection of spoken versus singing voices, chorus, musical instrument categories, and so on).

# Descriptive and analytical information

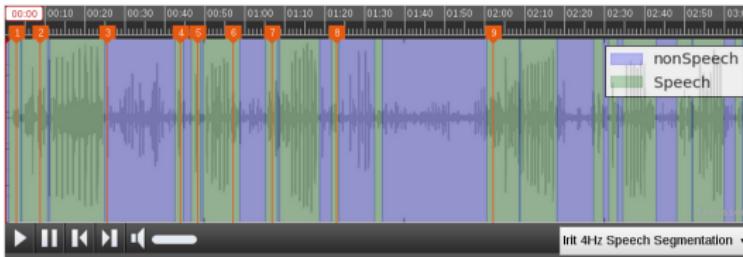

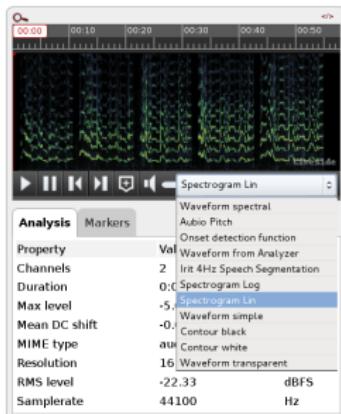

## Visual representation and segmentation

### Visual representation of the sound

The embedded TimeSide audio player allows for a selection of various visual representations of the sound (e.g. **waveforms** and **spectrograms**) and some representations of computational **analysis**.

### Segmentation

Automatic analysis can produce a list of **time-segments** associated with **labels** (e.g. detection of spoken versus singing voices, chorus, musical instrument categories, and so on).

# Descriptive and analytical information on the audio content

## Annotations

### Markers

- The embedded audio player also enables annotation of the audio content through **time-coded markers**.
- These annotations are **indexed** through the database.
- Users can create their own annotations and **share** them with colleagues.

# TimeSide, an audio analysis framework

- 1 Introduction
- 2 The Telemeta platform
- 3 TimeSide, an audio analysis framework
  - Audio management
  - Audio features extraction
- 4 Sound archives of the CNRS - Musée de l'Homme
- 5 The DIADEMS project
- 6 Conclusion

# TimeSide

## An open web audio processing framework

- TimeSide is the **signal processing engine** of Telemeta developed and published as a separate project.
- TimeSide is an *open-source audio analysis and visualization framework* based on both **Python** and **JavaScript** languages that provides state-of-the-art signal processing and machine learning algorithms together with **web audio** capabilities for displaying and streaming files.

<https://github.com/yomguy/TimeSide/>

## Audio management

TimeSide provides the following main features:

- Smart dynamic audio player with enhanced visualization (e.g. waveform, spectrogram) that can be embedded into any html page through *iframe* (live example: [Yomguy blog](#))
- Multi-format support: decodes the vast majority of audio and video formats
- On-the-fly audio analysis, transcoding, streaming and metadata embedding based on an easy plugin architecture.

# Audio features extraction

## Audio features extraction

TimeSide incorporates some state-of-the-art **audio feature extraction libraries** such as:

- Aubio: <http://aubio.org>
- Yaafe: <http://yaafe.sourceforge.net>
- Vamp plugins: <http://www.vamp-plugins.org>

Given the extracted features, every sound item in a given collection can be automatically analyzed.

The results of this analysis can be:

- Serialized to the web browser through common markup languages: XML, JSON and YAML
- Stored in a scientific file format (e.g. NumPy format or HDF5)
- Exported to sound visualization and annotation software (e.g. Sonic Visualizer)

# TimeSide engine architecture

# Sound archives of the CNRS - Musée de l'Homme

1 Introduction

2 The Telemeta platform

3 TimeSide, an audio analysis framework

4 Sound archives of the CNRS - Musée de l'Homme

- Archiving research materials
- Uses and users of digital sound archives

5 The DIADEMS project

# Sound archives of the CNRS - Musée de l'Homme

- Since June 2011, the Telemeta platform has been used by the **Sound archives of the CNRS - Musée de l'Homme<sup>a</sup>** and managed by the CREM.
- These archives available for researchers, students and (when copyright allows) to a broader audience.
- It is one of the most important Sound archives library in Europe
- Through this platform, these archives can be shared, discussed and analyzed.

---

<sup>a</sup><http://archives.crem-cnrs.fr>

# Archiving research materials

- The Sound archives of the *CNRS - Musée de l'Homme* have been collected by researchers attached to numerous research institutions across the world.
- Most of the recordings come from the fieldwork of researchers in **all continents** during the last **110 years**.
- Nearly **3700 hours of record collections** e.g. more than 5000 discs, many of which are very rare)
- **4000 hours of unpublished recordings**, from early research expeditions (e.g. Dakar-Djibouti (1932), Ogooué-Congo (1946)).
- **47,200 items** containing more than **26,000 sound files** (including 12,000 sounds on free access since May 2014).

# Uses and users of digital sound archives

- Three main activities: **archiving, research and education**
- Three main disciplines: **Ethnomusicology, Anthropology and Linguistic**
- Primary users of the platform are archivists, researchers, students and professors of these disciplines.
- Nonetheless, a qualitative survey showed that other disciplines (such as Art History) have used the platform.
- When used for education, the platform provides a wide array of teaching materials to illustrate the work of students as well as support teaching curricula.

# Uses and users of digital sound archives

## A collaborative experience

- The sharing of data offer resources to researchers from all over the world and allows several people to **collaborate on the enrichment of the database**.
- Researchers from different institutions can work together on specific audio materials and conduct individual research from both synchronic and diachronic perspectives on their own material, the material of others, or both.
- Users can submit their own archives to protect them.
- Furthermore, it facilitates the ethical task of **returning the recorded music to the communities who produced it** and to get local populations involved in their own cultural heritage.

# The DIADEMS project

1 Introduction

2 The Telemeta platform

3 TimeSide, an audio analysis framework

4 Sound archives of the CNRS - Musée de l'Homme

5 The DIADEMS project

- Consortium and goals
- The method of a new interdisciplinary research
- Evaluation and future improvements

# The DIADEMS project

Started in January 2013, the French national research program DIADEMS is a multi-disciplinary project dedicated to the **Description, Indexation, Access to Ethnomusicological and Sound Documents**.

## The consortium

### Science and Technology of Information and Communication domain

Institute of research in computing science of Toulouse  
Laboratory of computing and mechanics for engineering sciences

Bordeaux Computer Science Research Laboratory

Laboratory of Musical Acoustic, Jean Le Rond d'Alembert Institute

### Musicology and Ethnomusicology domain

Laboratory of Ethnology and Comparative Sociology

Research Center for Ethnomusicology

National Museum of Natural History

## Development

Parisson, the company involved in the development of Telemeta.

# Goals of the DIADEMS project

## Goals and on-going development

- The goal of the DIADEMS project is to develop computer tools to **automatically index** or assist the indexation of the recording content from the audio signal.
- Ongoing work consists of implementing advanced **classification, indexation, segmentation and similarity analysis** methods.
- **Besides music analysis**, such automatic tools also deal with speech and other types of sounds present ethnomusicological recordings like **speech, environmental noises and noises generated by the recording process**

# The method of a new interdisciplinary research

- In this research program, groups from **different backgrounds** are working together.
- The first challenge was to initiate a common interest and a **mutual understanding**.
- In this process, DIADEMS gave us the opportunity to improve our understanding on the **link between the semantics and acoustics of voice production** in order to be able to specify the classification and indexation tasks.

# Evaluation and Future improvements

## Development and Evaluations

- Interesting preliminary results have been obtained regarding the detection of start times of recording sessions, speech recognition, singing voice recognition and musical instrument family classification.
- The robustness of these processings is assessed using **criteria defined by the final users**: teachers, students, researchers and musicians.
- **After validation**, Analysis and Annotation tools, as well as the provided annotations, will be integrated in the Telemeta platform.

# Conclusion

- 1 Introduction
- 2 The Telemeta platform
- 3 TimeSide, an audio analysis framework
- 4 Sound archives of the CNRS - Musée de l'Homme
- 5 The DIADEMS project
- 6 Conclusion

# Conclusion

- Telemeta is a **fully operational** web audio framework for managing digital sound archives
- It's an **open-source** software (-> feel free to use, fork or contribute)
- Through the Sound archives of the CNRS - Musée de l'Homme, it is now used by many ethnomusicologists around the world for research or education purposes.
- Its collaborative nature enable a **continuous enrichment** of the audio content, the metadata and the analysis tools.

# Conclusion

- Telemeta is a **fully operational** web audio framework for managing digital sound archives
- It's an **open-source** software (-> feel free to use, fork or contribute)
- Through the Sound archives of the CNRS - Musée de l'Homme, it is now used by many ethnomusicologists around the world for research or education purposes.
- Its collaborative nature enable a **continuous enrichment** of the audio content, the metadata and the analysis tools.

# Conclusion

- Telemeta is a **fully operational** web audio framework for managing digital sound archives
- It's an **open-source** software (-> feel free to use, fork or contribute)
- Through the Sound archives of the CNRS - Musée de l'Homme, it is now used by many ethnomusicologists around the world for research or education purposes.
- Its collaborative nature enable a **continuous enrichment** of the audio content, the metadata and the analysis tools.

# Conclusion

- Telemeta is a **fully operational** web audio framework for managing digital sound archives
- It's an **open-source** software (-> feel free to use, fork or contribute)
- Through the Sound archives of the CNRS - Musée de l'Homme, it is now used by many ethnomusicologists around the world for research or education purposes.
- Its collaborative nature enable a **continuous enrichment** of the audio content, the metadata and the analysis tools.

# Conclusion

## Future developments

Future developments will turn Telemeta into:

- an efficient **annotation platform** (with zoom and segment selection)
- an **social and collaborative platform** (user access management and social stuff)
- an **interdisciplinary** collaborative platform between IT and ethno with the joint development of automatic analysis and indexation tools

Regarding TimeSide, a Web-API is being developed to provide audio analysis services over the web.

**Geographic and cultural informations**

Location	Afrique du Sud, Afrique australe, Afrique
Location details	Sikhwankenqi, au sud de Lady Frere, Eastern Cape Province
Population / social group	Xhosa
Ethnographic context	Chanteuses menantes : Nothulethu Polowana et Nofuniswa Mehlo.

CD.1 - Afrique / Afrique du Sud

«Comme tous les chants des Xhosa, le chant intitulé Nontyolo est caractérisé par une forme cyclique et respiratoire. Ici, c'est l'arc musical frotté (umrhube), joué par une jeune fille, qui tient le rôle de la chanteuse menante (ligne H1 de la transcription; H = hlabeli ; « menant »). Six autres filles chantent les parties des suivantes (L1 à L5 ; L = landela, « suivant »). Elles choisissent leurs lignes mélodiques pendant que l'arc musical continue à jouer la même ligne mélodique (H1). En modifiant le volume de la cavité buccale, la joueuse de l'arc musical sélectionne les harmoniques des deux sons fondamentaux pour en faire la mélodie.

Les lignes des « suivantes » (L1 et L2) sont en fait des parties en polyphonie parallèle (appelées en xhosa intlubo, « variations ») de la ligne « menante » (H1). Pour cette raison, ces lignes commencent au même point rythmique que H1 (indiqué par une double barre). Les lignes L3, L4 et L5 sont des parties polyphoniques en tulage, commençant à un autre point du cycle (L3 et L4 sont intlubo, c'est-à-dire des parties parallèles utilisant le même texte et les mêmes tons de la langue). La polyphonie est basée sur les harmoniques de l'arc musical, mais d'autres « sons non harmoniques » sont également utilisés.

Les Xhosa emploient des rythmes complexes, souvent deux ou plusieurs rythmes simultanément, et l'art du déguisement rythmique est très
